# 1 System Requirements

## 1.1 Functional Requirements

### 1.1.1 Download of Public-facing Data

Table 1: Download of Public-facing Data

<b>Title</b>	Download of Public-facing Data
<b>Description</b>	Users can choose an output format for queried data and download it locally to their machine.
<b>Source Scenario</b>	FR1
<b>Priority</b>	Mandatory: 0
<b>Precondition(s)</b>	List of layers consisting of cadastral, multimedia, and workshop data is passed to the server. Output format is given: one of <b>GeoJSON</b> , esri <b>shapefile</b> , <b>kml</b> , or <b>CSV</b>
<b>Postcondition(s)</b>	Data is packaged into a zip file and sent back to the browser for a local download.
<b>Use Case Diagram</b>	Figure 1

## 1.2 Non-Functional Requirements

### 1.2.1 Minimum Simultaneous Downloads

Table 2: Minimum Simultaneous Downloads

<b>Title</b>	Minimum Simultaneous Downloads
<b>Description</b>	The download server must handle up to 3 simultaneous download requests.
<b>Source Scenario</b>	NFR1
<b>Priority</b>	High: 1
<b>Applicable FR(s)</b>	FR1

## 2 System Constraints

### 2.1 Tool Constraints

#### 2.1.1 Web Application Framework Constraint

References:

- <https://nodejs.org>
- <https://expressjs.com/>

Table 3: Web Application Framework Constraint

<b>Title</b>	Web Application Framework Constraint
<b>Description</b>	We will be using Express/Node.js as the framework for the backend. This will allow for greater ease of deployment on the server-side.
<b>Priority</b>	Mandatory: 0

Table 4: geojson2 Conversion Package

<b>Title</b>	geojson2 Conversion Package
<b>Description</b>	We will be using geojson2 which is a geojson exporting utility belt that can convert a geojson object into several other formats. This package uses the ogr2ogr node package to perform the conversions.
<b>Priority</b>	Mandatory: 0

Table 5: Archiver Packaging Tool

<b>Title</b>	Archiver Packaging Tool
<b>Description</b>	We will use the Archiver node module in order to package all of the requested files into a zip or tar file.
<b>Priority</b>	High: 2

### 2.2 Language Constraints

#### 2.2.1 Backend REST Framework

Table 6: Backend REST Framework

<b>Title</b>	Backend REST Framework
<b>Description</b>	Because we are using the Express framework, Javascript is a requirement. Therefore, the backend will be written in Javascript.
<b>Priority</b>	Mandatory: 0

## 2.3 Platform Constraints

### 2.3.1 Web Service Platform

Table 7: Web Service Platform

<b>Title</b>	Web Service Platform
<b>Description</b>	Express/Node.js is, fortunately, platform independent. Further, a platform constraint has not been set by the client for this team.
<b>Priority</b>	Lowest: 5

## 2.4 Hardware Constraints

As we are using Amazon EC2 for deployment, our hardware constraints are set by the free-tier package Amazon provides.

### References:

- <https://aws.amazon.com/ec2/>

### 2.4.1 Storage Constraints

Table 8: Storage Constraints

<b>Title</b>	Storage Constraints
<b>Description</b>	Our storage constraint is set by Amazon EC2. However, storage constraints are of minimal priority for this team as there will be nothing stored on disk.
<b>Priority</b>	Lowest: 5

### 2.4.2 Computation Constraints

Table 9: Computation Constraints

<b>Title</b>	Computation Constraints
<b>Description</b>	Our computation constraint is also set by Amazon EC2. Its free-tier service is ample for this team as our service primarily converts and packages data.
<b>Priority</b>	Low: 4

## 2.5 Network Constraints

### 2.5.1 Access Database

Table 10: Access Database

<b>Title</b>	Access Database
<b>Description</b>	Our service must be able to query a PostGRES database over the network in order to fetch geospatial and multimedia data.
<b>Priority</b>	Mandatory: 0

## 2.5.2 Download Response

Table 11: Download Response

<b>Title</b>	Download Response
<b>Description</b>	Our service must be able to package and send back data to the browser over HTTP protocol for local download.
<b>Priority</b>	Mandatory: 0

## 2.6 Deployment Constraints

### 2.6.1 AWS EC2 Deployment

Table 12: AWS EC2 Deployment

<b>Title</b>	AWS EC2 Deployment
<b>Description</b>	The web service will be deployed on Amazon EC2. Amazon provides a free-tier service for 12 months that will last the duration of the semester.
<b>Priority</b>	Medium: 3

## 2.7 Transition & Support Constraints

### 2.7.1 Transitional Requirements

Table 13: Transitional Requirements

<b>Title</b>	Transitional Requirements
<b>Description</b>	Once the user selects the needed data elements and desired file format, our service must download the data and package it in a convenient manner for the user.
<b>Priority</b>	Mandatory: 0

### 2.7.2 Continued Maintenance

Table 14: End of Life

<b>Title</b>	End of Life
<b>Description</b>	This service is a term project for the course CSC431. As such, this service will no longer be maintained after the final grading period, and a new team is required to ensure continued development.
<b>Priority</b>	Lowest: 5

## 2.8 Budget & Schedule Constraints

### 2.8.1 Time Constraints

Table 15: Time Constraints

<b>Title</b>	Time Constraints
<b>Description</b>	The service must be designed and developed before the end of the semester: May 7, 2018. A working prototype must be released before this date.
<b>Priority</b>	Mandatory: 0

### 2.8.2 Budget Constraints

Table 16: Budget Constraints

<b>Title</b>	Budget Constraints
<b>Description</b>	No funds have been made available by the client. Therefore, this project has no budget.
<b>Priority</b>	Lowest: 5

## 2.9 Miscellaneous Constraints

### 2.9.1 Performance Constraints

Table 17: Performance Constraints

<b>Title</b>	Performance Constraints
<b>Description</b>	The speed and quality of the service is directly dependent on the reliability of the Search results and the access database's schema.
<b>Priority</b>	Low: 4

### 3 Requirements Modeling

#### 3.1 Download Public-Facing Data

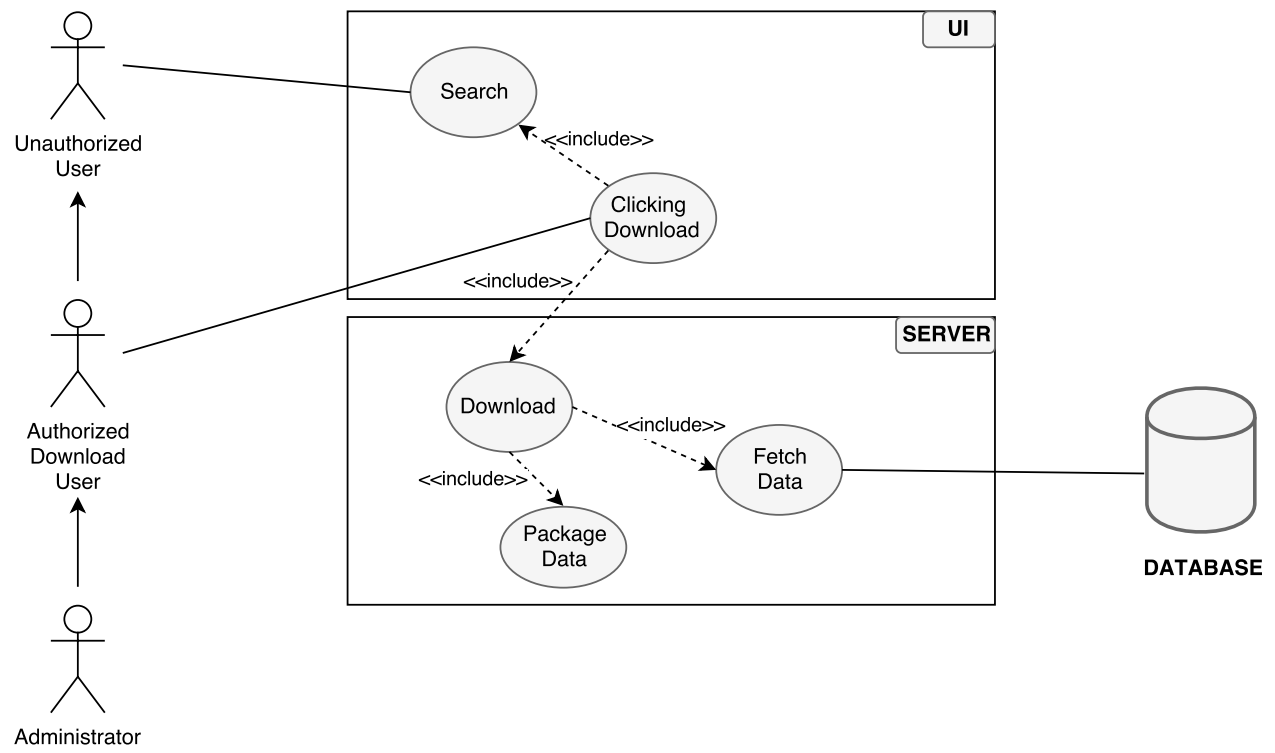

Table 18: FR1 Scenario

<b>Statement of Purpose</b>	The user is interested in downloading useful information in order to quicken the process of obtaining land grants.
<b>Individual</b>	A public (unauthorized), registered (authorized), or administrator user.
<b>Trigger</b>	The user presses a download button.
<b>Precondition(s)</b>	A user search has been completed, filtered for workshop, multimedia, and cadastral data, and may have been subsetted.
<b>Postcondition(s)</b>	A compressed file is downloaded to the user's local machine.
<b>Assumptions</b>	N/A
<b>Steps of Scenario</b>	<ol style="list-style-type: none"><li>1. User A observes a list of results from a completed search.</li><li>2. User A selects a checkbox for result #3.</li><li>3. User A presses the download button.</li><li>4. A compressed file of data relevant to result #3 is downloaded locally to User A's machine.</li></ol>

Table 19: Primary Use Case

<b>Name</b>	Download of Public-Facing Data Use Case
<b>Description</b>	This is the primary use case for the flow of the download system.
<b>Actors</b>	The Administrator, Authorized User, and Unauthorized User.
<b>Trigger</b>	This use case is initiated when a user clicks the download button.
<b>Precondition(s)</b>	The user has received Search results, chosen the files to download, and clicked the download button.
<b>Basic Flow</b>	<ol style="list-style-type: none"> <li>1. The user, regardless of their authentication level, selects files to download from the Search results.</li> <li>2. The user clicks the download button.</li> <li>3. For an unauthorized user, the system begins the download process only if the requested data is public. The download of private data requires either an appropriate authentication level or permission from the administrator.</li> <li>4. For an authorized user: the system begins the download process for the requested data.</li> <li>5. If the user has permissions to download the requested data, the system fetches the data from the database and packages it.</li> <li>6. A compressed file of data relevant to the requested data is downloaded locally to the user's machine.</li> </ol>
<b>Exceptions</b>	If the user does not have the proper authentication level to download private data, they must request access from an administrator. If there are any errors in the flow, the user may be requested to retry the download.
<b>Postcondition(s)</b>	The user has received a compressed file of their requested data, and any database connections created to download the data are closed.
<b>Special Requirements</b>	Download of data requires either an appropriate authentication level or permission from an administrator. Further, in the initial implementation, only 3 simultaneous download requests are permitted. This use case also assumes that the Search results are accurate and the requested data is stored in the database.

Figure 1: Download Public-Facing Data

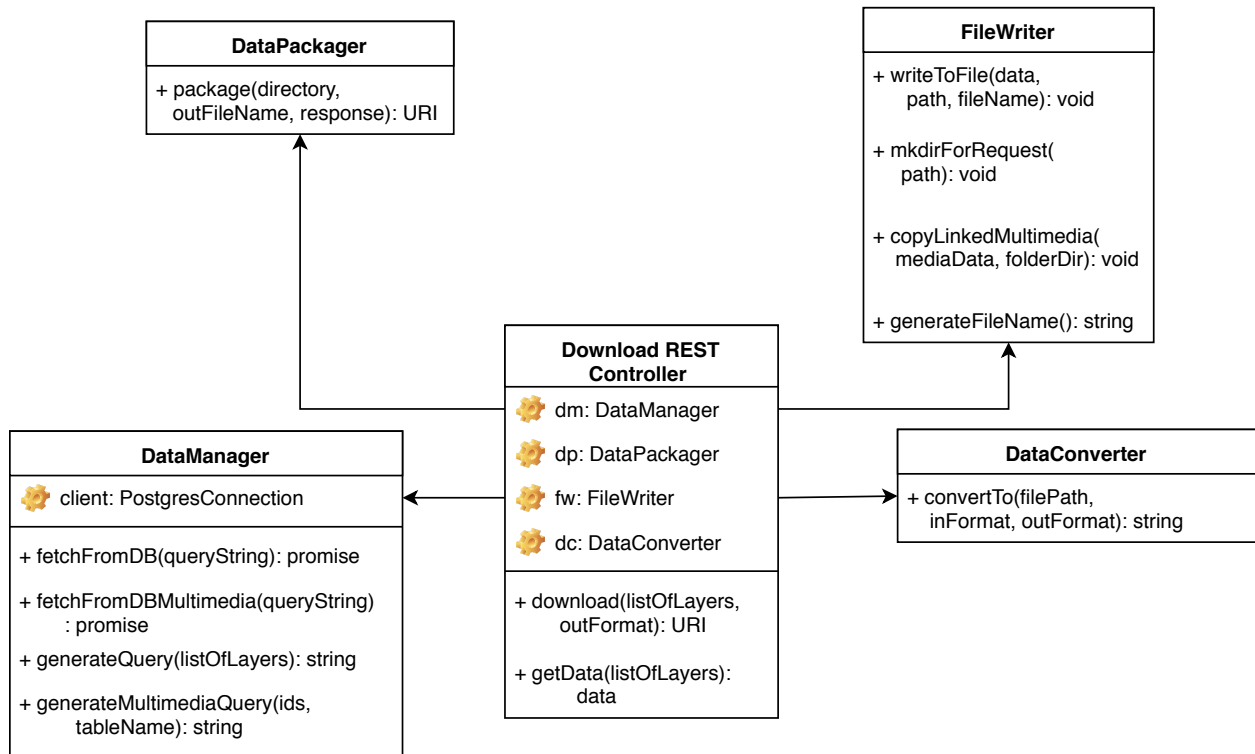

### 3.2 Minimum Simultaneous Downloads

Table 20: NFR1 Scenario

<b>Statement of Purpose</b>	The system should be able to handle at least three simultaneous download requests.
<b>Individual</b>	A public (unauthorized), registered (authorized), or administrator user.
<b>Trigger</b>	Three or more users select pieces of information to download and press the download button simultaneously.
<b>Precondition(s)</b>	The users' search has been completed, filtered for workshop, multimedia, and cadastral data, and may have been subsetted. The users have selected pieces of information to download.
<b>Postcondition(s)</b>	The pieces of information selected for downloading are compressed and downloaded to the users' local machines.
<b>Assumptions</b>	Each user makes one download request after selecting the necessary pieces of information and pressing the download button on the front end. The minimum requirement is to handle up to three simultaneous download requests. The current iteration of the system can support up to 100 simultaneous download requests.
<b>Steps of Scenario</b>	<ol style="list-style-type: none"><li>1. Users A, B, and C observe a list of results from a completed search.</li><li>2. Users A, B, and C select pieces of information to download by clicking on checkboxes.</li><li>3. Users A, B, and C press the download button simultaneously.</li><li>4. The multiple pieces of information relevant to the selected checkboxes are individually compressed and downloaded locally to the machines of Users A, B, and C.</li></ol>

### 3.3 Class Diagram

Figure 2: Class Diagram

## 4 Evolutionary Requirements (TBA)

At this moment, there are no evolutionary requirements set for this project.

### 4.1 Functional Requirements

#### 4.1.1 Placeholder

Table 21: Placeholder

<b>Title</b>	Insert title
<b>Description</b>	A one or two sentence description
<b>Priority</b>	Priority from 0 (highest) - 5 (lowest)
<b>Precondition(s)</b>	What needs to happen before
<b>Postcondition(s)</b>	What happens as a result
<b>Use Case Diagram</b>	Link or number, if present

### 4.2 Functional Requirements

#### 4.2.1 Placeholder

Table 22: Placeholder

<b>Title</b>	Insert title
<b>Description</b>	A one or two sentence description
<b>Priority</b>	Priority from 0 (highest) - 5 (lowest)
<b>Applicable FR(s)</b>	What functional requirement(s) is this applicable to?
